

Looking for a Double Dividend of a Carbon Tax in Argentina: an input-output evaluation

Paula Micaela Achenbach, María Priscila Ramos and Carlos Adrián Romero

IIEP-Baires (UBA-CONICET)
ICABR2020, 21st October 2020.

Table of contents

1. Introduction
2. Methodological Approach
3. Results
4. Conclusions

Introduction

Climate Change in Argentina

- GHG emissions: 368 MtCO₂eq in 2017 (0.5% worldwide) which 60% are CO₂ emissions.
- GHG emissions per capita higher than world's average

Positive relationship

The index falls, sign of decoupling

Climate Change in Argentina

- GHG emissions: 368 MtCO₂eq in 2017 (0.5% worldwide) which 60% are CO₂ emissions.
- GHG emissions per capita higher than world's average

Positive relationship

The index falls, sign of decoupling

Consumption: local or imported

Production: local or exported.

Similar evolution

CO2 emissions in Argentina

From Consumption

Relevant sectors:

Transport; Electricity,

Gas and Water; Food and Beverage

CO2 emissions in Argentina

From Consumption

Relevant sectors:

Transport; Electricity,
Gas and Water; Food and Beverage

From Production

Relevant sectors:

Electricity, Gas and Water; Transport;
Petroleum, Chemical and Non-Metallic
Mineral Products

Argentina's Climate Change initiatives

- Reduction of subsidies programs for the energy consumption.
- Policies of zero deforestation
- Laws that establish objectives for the introduction of renewable sources into the electricity consumption matrix
- Projects that promote the use of renewable energies in rural areas

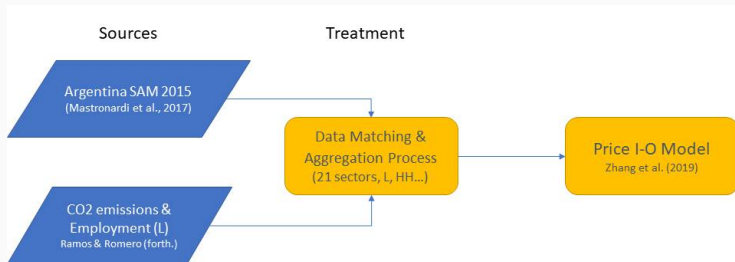

Objectives of this research

1. To analyse the impact of the introduction of a carbon tax in the Argentine economy and
2. To test whether a Double Dividend can exist when the revenue of the tax is inserted back into the economy.

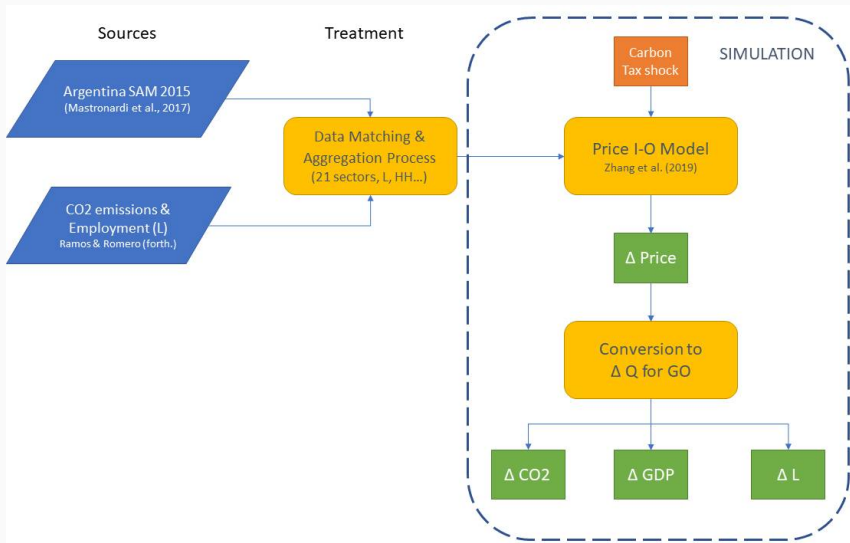

Methodological Approach

1. Input-Output Model
2. Simulation scenarios

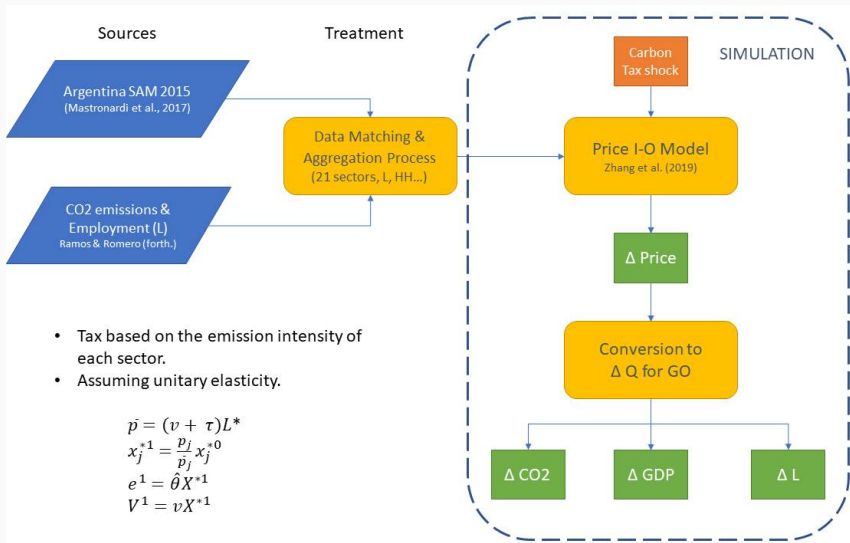

Input-Output Model

Input-Output Model

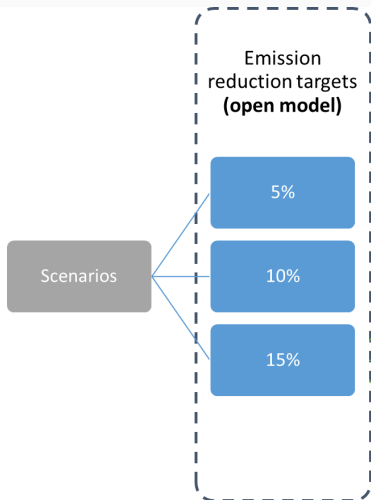

Input-Output Model

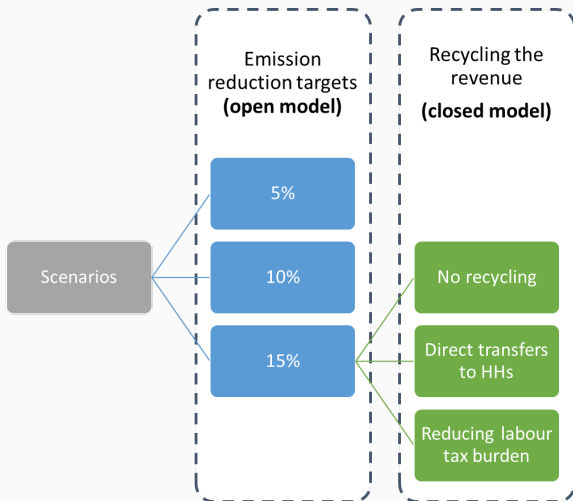

1. Input-Output Model
2. **Simulation scenarios**

Simulation Scenarios

Simulation Scenarios

Results

Results

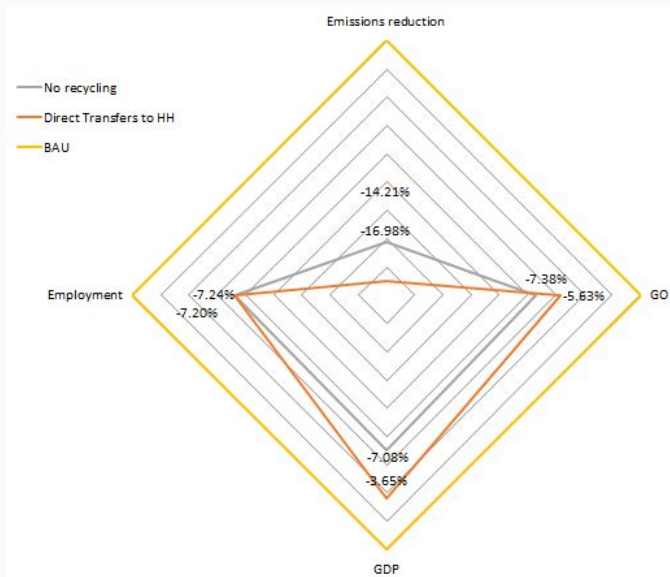

- The introduction of a carbon tax results in a drop in the GDP and GO.
- The higher the value of the tax the bigger the fall on both indicators.

Table 1: Carbon taxes meeting CO2 reduction targets - Open Model

| Tax value (per tn) | CO2 Emission reduction | GDP variation |
|--------------------|------------------------|---------------|
| \$504 | -5% | -1.66% |
| \$1,078 | -10% | -3.41% |
| \$1,735 | -15% | -5.25% |

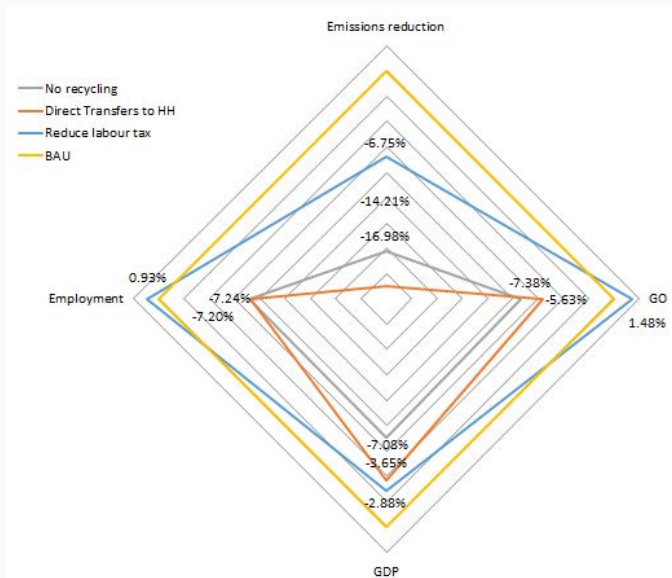

Double Dividend Hypothesis

Carbon tax: AR\$ 1,735 / tCO₂ - Close model

Double Dividend Hypothesis

Carbon tax: AR\$ 1,735 / tCO₂ - Close model

Conclusions

Summary

- Analyze the effect on the economy when a carbon tax is included
- Test if a Double Dividend can occur when the revenue is recycled.
- **Results:** a Labor Double Dividend can be achieved.

Summary

- Analyze the effect on the economy when a carbon tax is included
- Test if a Double Dividend can occur when the revenue is recycled.
- **Results:** a Labor Double Dividend can be achieved.

Limitations

- Linearity
- Homogeneous pricing system
- Innovations cannot be predicted
- Argentina as developing country

Summary

- Analyze the effect on the economy when a carbon tax is included
- Test if a Double Dividend can occur when the revenue is recycled.
- **Results:** a Labor Double Dividend can be achieved.

Limitations

- Linearity
- Homogeneous pricing system
- Innovations cannot be predicted
- Argentina as developing country

Future Extensions

- Analysis with a Dynamic I-O Model
- Differentiating the HH account
- Other types of revenue recycling
